

## DESIGN MANAGEMENT PROCESS

### Introduction

This is the process which can be applied to all processes associated with the management of design. This should be updated and changed for each project or design. The key function of the design management process is:

- To help understand and communicate the key contractual obligations of all Parties involved in the scope of works
- Co-ordinate the designers, ensure information is released on schedule and that McGee preferred method of construction is incorporated into the design
- To ensure all aspects of design are covered, and ensure that the correct warranties and insurances are provided
- To be on hand to ensure that the BEP and information flow is adhered to

The design manager needs to have a handle of the commercial aspects of the design: responsibility and liability of parties, appointments and fees. The design manager should be the gateway between the designers and the site team.
